Ozonoterapiya
haqida malumot.

This is a unique non-drug method of treatment with an ozone-oxygen mixture, in which oxygen is additionally introduced into the body bypassing the lungs. The addition of ozone to oxygen creates a therapeutic agent with such an effective and versatile effect that no medicine can compare with it. We cannot live without oxygen, we must constantly supply ourselves with it. To do this, we inhale 20,000 liters of air daily. Oxygen is necessary for healthy body cells, saturating them with energy. Lack of oxygen leads to fatigue, the occurrence of diseases, disorders of the immune system, accelerated aging. (Ozone O_3) - it is a gas with a characteristic odor, it is a type of oxygen, its molecule consists of 3 atoms, unlike the oxygen that we breathe (O_2), whose molecule contains 2 atoms. The triatomic molecule of ozone provides its great activity in joining living cells and a high ability to oxidize. Ozone introduced into the body contributes to a significant saturation of blood and tissues with oxygen. Being an active form of oxygen, it fights with many bacteria, viruses, destroying them together with toxic and destructive cells, protects us from diseases. In 1996, Nobel Prize laureate Dr. Otto Warburg found that the main prerequisite for the development of cancer is a lack of

Benefits Ozonotherapy

Diabetes is not a sentence

The insidious disease of diabetes, it flows in different ways. Some patients require constant injections of insulin. In others, it allows you to limit yourself to taking pills, and the third - generally costing a lot. But for all three categories of patients (in for all diabetes), it is dangerous for its complications. The fact is that 30% of them eventually have serious vision problems, 2% generally go blind.

Old age will recede

In connection with age-related changes, primarily in the vessels, chronic oxygen deficiency increases. This is especially true of the brain using the largest amount of oxygen. Comprising 2% of the total body weight, it requires 20% of the oxygen consumed by our body. Hence the decrease in memory, health, physical activity, impaired organ function. Ozone therapy eliminates oxygen deficiency, increases energy metabolism in tissues, restores the normal functioning of organs and systems.

If immunity is reduced

Strengthening the energy of ozone primarily increases the energy of the immune system. It increases the body's defenses. Therefore, ozone therapy helps to treat diseases caused by impaired immune responses - bronchial asthma, rheumatoid arthritis. Ozone is a good help for many chronic diseases, chronic disease is always a consequence of secondary immunodeficiency. Particular attention should be paid to the effectiveness of ozone in children who are often and for a long time sick, who are treated with gas aerosols.

What will save you from hepatitis?

Similarly, ozone acts on the hepatitis virus. It is effective for any type of virus A, B or C. Ozone therapy gives the same results as treatment with modern drugs. It is only tolerated by patients much easier, and costs several times cheaper. Repeated courses of ozone therapy protect against the development of complications of hepatitis - cirrhosis and liver cancer.

Best friend of the heart and blood vessels

Human health largely depends on the state of blood vessels and blood composition. With ozone therapy, the blood becomes more saturated with oxygen, its elements are qualitatively improved: red blood cells, white blood cells, platelets. Ozone has an expanding effect on blood vessels, especially on capillaries. All this provides an increased supply of oxygen and nutrients to organs and tissues. Therefore, ozonotherapy is effective in diseases associated with vascular lesions, circulatory disorders and lack of oxygen - coronary heart disease, cerebral vascular sclerosis and lower extremities.

Ozone cosmetology

In the distribution of the oxygen resource, the skin receives oxygen in the last turn, despite the fact that the skin first takes on the blow of the external environment. Normally, this is 1-2%, in conditions of deficiency, even less. Ozone therapy eliminates oxygen deficiency, saturating the 'choking' skin with oxygen. In dermatocosmetology, ozone therapy is an indispensable method for the correction of acne. It is able to smooth wrinkles, help in the treatment of psoriasis.

Our clients says

Kristina Pak

My name is Kristina. I found this medical center very good. Because they cured my illness, which lasted from 2015. Currently, I have not yet any symptoms of the disease. I am very happy.
